**Routing** refers to how an application's endpoints (URIs) respond to client requests. For an introduction to routing, see Basic routing. You define routing using methods of the Express app object that correspond to HTTP methods; for example, app.get() to handle GET requests and app post to handle POST requests. For a full list, see app.METHOD. You can also use app.all() to handle all HTTP methods and app.use() to specify middleware as the callback function (See Using middleware for details). These routing methods specify a callback function (sometimes called "handler functions") called when the application receives a request to the specified route (endpoint) and HTTP method. In other words, the application "listens" for requests that match the specified route(s) and method(s), and when it detects a match, it calls the specified callback function.

Black Lives Matter.

Support the Equal Justice Initiative.

**Express** 

Routing

In fact, the routing methods can have more than one callback function as arguments. With multiple callback functions, it is important to provide next as an argument to the callback function and then call next () within the body of the function to hand off control to the next callback. The following code is an example of a very basic route. var express = require('express') var app = express()

// respond with "hello world" when a GET request is made to the homepage app\_get('/', function (req, res) { res\_send('hello world') }) **Route methods** A route method is derived from one of the HTTP methods, and is attached to an instance of the expre ss class. The following code is an example of routes that are defined for the GET and the POST methods to the root of the app.

// GET method route app.get('/', function (req, res) { res\_send('GET request to the homepage') }) // POST method route app.post('/', function (req, res) {

res\_send('POST request to the homepage')

}) Express supports methods that correspond to all HTTP request methods: get, post, and so on. For a full list, see app.METHOD. to load middleware functions at a path for all HTTP

There is a special routing method, app.all(), used request methods. For example, the following handler is executed for requests to the route "/secret" whether using GET, POST, PUT, DELETE, or any other HTTP request method supported in the http module. app.all('/secret', function (req, res,

next) { console log('Accessing the secret

section ...') next() // pass control to the next handler

})

Route paths

Route paths, in combination with a request method,

define the endpoints at which requests can be made.

Route paths can be strings, string patterns, or regular

expressions. The characters ?, +, \*, and () are subsets of their regular expression counterparts. The hyphen (–) and the dot (1) are interpreted literally by string-based

paths.

If you need to use the dollar character (\$) in a path

string, enclose it escaped within ([ and ]). For

k'', would be "/data/([\\$])book".

example, the path string for requests at "/data/\$boo

Express uses path-to-regexp for matching the route

paths; see the path-to-regexp documentation for all the possibilities in defining route paths. Express Route Tester is a handy tool for testing basic Express routes,

although it does not support pattern matching.

Query strings are not part of the route path.

strings.

})

})

/random.text.

res) {

string patterns.

})

{

so on.

{

})

{

})

res) {

expressions:

})

})

keys.

kId

Here are some examples of route paths based on

app.get('/', function (req, res) {

This route path will match requests to /about.

app\_get('/about', function (req, res)

app.get('/random.text', function (req,

Here are some examples of route paths based on

app\_get('/ab?cd', function (req, res)

This route path will match abcd, abbcd, abbbcd, and

app.get('/ab+cd', function (req, res)

This route path will match abcd, abxcd, abRANDOMcd,

app.get('/ab\*cd', function (req, res)

This route path will match /abe and /abcde.

app.get('/ab(cd)?e', function (req,

This route path will match anything with an "a" in it.

This route path will match butterfly and dragonfl y, but not butterflyman, dragonflyman, and so on.

app.get(/.\*fly\$/, function (req, res)

Route parameters are named URL segments that are used to capture the values specified at their position in the URL. The captured values are populated in the

Route path: /users/:userId/books/:boo

Request URL: http://localhost:3000/us

req.params: { "userId": "34", "bookId

specify the route parameters in the path of the route

app.get('/users/:userId/books/:bookId',

The name of route parameters must be made up of

Since the hyphen (–) and the dot (1) are interpreted

Request URL: http://localhost:3000/fl

req.params: { "from": "LAX", "to": "S

Route path: /plantae/:genus.:species Request URL: http://localhost:3000/pl

req.params: { "genus": "Prunus", "spe

To have more control over the exact string that can be matched by a route parameter, you can append a

Request URL: http://localhost:3000/us

Because the regular expression is usually part of a literal string, be sure to escape any \ characters with

In Express 4.x, the \* character in regular expressions is not interpreted in the usual way. As a workaround, use {0,} instead of \*. This will likely be fixed in Express 5.

You can provide multiple callback functions that

route') to bypass the remaining route callbacks.

Route handlers can be in the form of a function, an array of functions, or combinations of both, as shown

A single callback function can handle a route. For

app.get('/example/a', function (req,

More than one callback function can handle a route

app.get('/example/b', function (req,

console log('the response will be

An array of callback functions can handle a route. For

var cb0 = function (req, res, next) {

var cb1 = function (req, res, next) {

app.get('/example/c', [cb0, cb1, cb2])

A combination of independent functions and arrays

var cb0 = function (req, res, next) {

var cb1 = function (req, res, next) {

app.get('/example/d', [cb0, cb1],

sent by the next function ...')

res\_send('Hello from D!')

The methods on the response object (res) in the

terminate the request-response cycle. If none of

these methods are called from a route handler, the

Send a JSON response.

JSONP support.

types.

Redirect a request.

the response body.

You can create chainable route handlers for a route

specified at a single location, creating modular routes is helpful, as is reducing redundancy and typos. For

Here is an example of chained route handlers that are

res.send('Get a random book')

path by using app.route(). Because the path is

more information about routes, see: Router()

.get(function (req, res) {

post(function (req, res) { res.send('Add a book')

put(function (req, res) {

res.send('Update the book')

Use the express. Router class to create modular, mountable route handlers. A Router instance is a complete middleware and routing system; for this

The following example creates a router as a module,

routes, and mounts the router module on a path in

reason, it is often referred to as a "mini-app".

loads a middleware function in it, defines some

Create a router file named birds.js in the app

var express = require('express')

// middleware that is specific to this

router\_use(function timeLog (req, res,

console log('Time: ', Date now())

router.get('/', function (req, res) {

router.get('/about', function (req,

var router = express.Router()

// define the home page route

res.send('Birds home page')

// define the about route

res.send('About birds')

Then, load the router module in the app:

var birds = require('./birds')

The app will now be able to handle requests to /bird
